

ABSTRACT OF THE DISCLOSURE

In a reflective slide fastener comprising a pair of fastener tapes, each fastener tape having a row of coupling  
5 elements fixedly secured to and along a longitudinal edge of the fastener tape, and reflective materials which exhibit retroreflection and are applied to the surfaces of the fastener tapes and/or coupling elements, the reflective materials are adapted to allow the color of the fastener tapes  
10 and/or coupling elements to be seen therethrough. The form of the reflective material includes a tape-like shape, a thread, and a thread-like shape formed from a tape. The preferred reflective material is a transparent or translucent retroreflective material containing a reflective layer  
15 formed from a metal compound which has permeability to light.
